Recruiting for Clinical Study on COVID-19 Smell Distortion

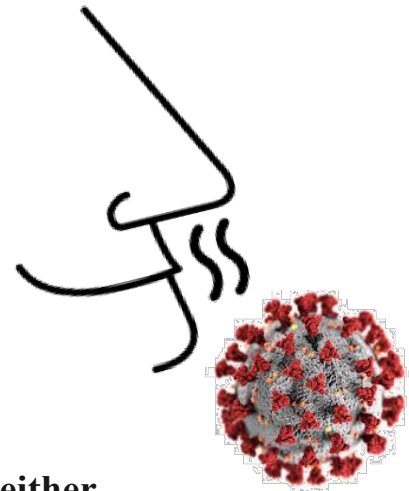

Persistent smell distortion (parosmia) due to COVID-19 is common! Stellate ganglion block (SGB) is an office-based procedure that has been proposed for treatment of smell distortions. We are recruiting adults for a study of the effectiveness of SGB as a treatment for parosmia due to COVID-19.

You may be able to participate if:

- You are age 18 to 70 living in the USA
- You have computer access and an email address
- You have persistent COVID-related parosmia

This study involves:

- In-person visit to assess smell loss and, if eligible, receive either the active or placebo SGB procedure
- Two virtual visits, requiring only internet access

**To participate, please email us at otooutcomes@wustl.edu
with the subject line 'SGB Study'**

FOR ANY QUESTIONS

Please contact the Clinical Research Outcomes Office at 314-454-2197.
